# Cox PH Models

# Landi Luo 12/7/2018

#### Load packages:

```
if (!require("pacman"))
  install.packages("pacman", repos = "http://cran.us.r-project.org/")
p_load("tidyverse", "survival", "kableExtra")

Import data:
breast <- readRDS(file = "breast_final.rds")

# delete all survival time = 0</pre>
```

### Cox Model: All Covariates

breast <- subset(breast, SRV TIME MON != 0)</pre>

# convert SEX to dummy: O=male, 1=female
breast\$SEX <- ifelse(breast\$SEX == 1, 0, 1)</pre>

Using the Breslow method of handling ties, we fit a Cox proportional hazards model to the data including all 13 covariates: race, sex, stage, breast subtype, age dx, age, marital status, benign tumor count, malignant tumor count, primary site, pr status, er status, insurance status.

```

## Cox Model: Top 9 Significant Variables

Using variable selection methods (LASSO, SCAD, MCP), we decided the top 9 significant variables were:

- Stage
- ERSTATUS
- PRSTATUS
- MALIGCOUNT
- RAC\_RECY
- PRIMSITE
- BRST\_SUBMAR\_STAT
- INSREC\_PUB

We fit a Cox model with these covariates plus sex:

```
fit2 <- coxph(Surv(SRV_TIME_MON, delta) ~ factor(SEX) + factor(stage) + factor(RAC_RECY) +
             factor(BRST_SUB) + factor(MAR_STAT) + MALIGCOUNT + factor(PRIMSITE) +
             factor(ERSTATUS) + factor(PRSTATUS) + factor(INSREC_PUB) ,
             data = breast, ties = "breslow" )
summary(fit2)

### Test PH Assumption for Sex

To test the proportional hazards assumption for Sex (a fixed-time covariate), we can create a time-dependent covariate  $Z_2(t)$ , defined as  $Z_2(t) = Z_1 \times g(t)$ , where g(t) is a known function of the time t. In most applications, we take  $g(t) = \ln(t)$ . A test of  $H_0: \beta_2 = 0$  is a test of the proportional hazards assumption.

##
## Likelihood ratio test=12.61 on 2 df, p=0.002
## n= 1742258, number of events= 3033
```

Using  $g(t) = \ln(t)$ , the Wald p-value for the test of  $H_0$ :  $\beta_2 = 0$  is 0.0044, which is significant at  $\alpha = 0.05$ . Thus, there is evidence that SEX covariate has nonproportional hazards. Therefore, we should stratify on Sex.

#### Stratify on Sex

Fix Cox model with the top 9 covariates, stratified on SEX.

```

## [1] 174.0883
1 - pchisq(X2, 9) #9 degrees of freedom for each covariate
```

#### ## [1] 0

The p-value is <<0.0001, so the assumption of using a stratified model is not met; the covariate effects are not the same between the two strata. So a stratified model is not appropriate.

```
# check ph assumption for all covariates?
test.ph <- cox.zph(fit2)
test.ph$table</pre>
